

Where are the complex curves in Khovanov homology?

Kyle Hayden (joint with
Isaac Sundberg and Alan Du)

May 5, 2022

What is Khovanov homology?

$$L \quad \rightsquigarrow \quad \text{Kh}(L) \quad (\text{bigraded } \mathbb{Z}\text{-module})$$

$$\Sigma \subset S^3 \times [0, 1]$$

$$\rightsquigarrow \text{Kh}(\Sigma) : \text{Kh}(L_0) \rightarrow \text{Kh}(L_1)$$

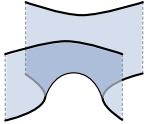

What isn't Khovanov homology?

Unlike gauge-/Floer-theoretic invariants, it doesn't involve geometry!

$$\left[\begin{array}{c} \diagup \diagdown \\ \diagdown \diagup \end{array} \right] = \left[\begin{array}{c} \cup \\ \cap \end{array} \right] - q^{-1} \left[\begin{array}{c} \rangle \\ \langle \end{array} \right]$$

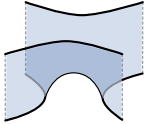

$$\left[\begin{array}{c} \diagup \diagdown \\ \diagdown \diagup \end{array} \right] = \left[\begin{array}{c} \smile \\ \frown \end{array} \right] - q^{-1} \left[\begin{array}{c} \rangle \\ \langle \end{array} \right]$$

Categorifies the Kauffman bracket and the Jones polynomial.

$$\left[\left[\begin{array}{c} \diagup \diagdown \\ \diagdown \diagup \end{array} \right] \right] = \left[\left[\begin{array}{c} \cup \\ \cap \end{array} \right] \right] \rightarrow q^{-1} \left[\begin{array}{c} \rangle \\ \langle \end{array} \right]$$

Categorifies the Kauffman bracket and the Jones polynomial.

$$\left[\begin{array}{c} \diagup \\ \diagdown \end{array} \right] = \left[\begin{array}{c} \cup \\ \cap \end{array} \right] \rightarrow q^{-1} \left[\begin{array}{c} \rangle \\ \langle \end{array} \right]$$

Categorifies the Kauffman bracket and the Jones polynomial.

- **Skein modules for 3-manifolds**
(Turaev '88, Przytycki '91)
- **Khovanov homology for links in thickened surfaces**
(Asaeda-Przytycki-Sikora '04)
- **Khovanov-Rozansky invariants for 4-manifolds**
(Morrison-Walker '12, Morrison-Walker-Wedrich '19,
Manolescu-Neithalath '20)
- **Slicing obstructions in B^4 and other 4-manifolds**
(Rasmussen '04, Manolescu-Marengon-Sarkar-Willis '19)

Q1: How can we use the maps $\text{Kh}(\Sigma)$ to study surfaces $\Sigma \subset B^4$?

Q2: Can we use computers to study these cobordism maps?

Q3: Can we understand these cobordism maps for complex curves?

?

Theorem (H-Sundberg, 2021)

Khovanov homology can distinguish smooth surfaces in B^4 that are isotopic via homeos but not diffeos of B^4 (rel ∂).

The examples will be holomorphically embedded in $B^4 \subset \mathbb{C}^2$, and we'll use a braid-theoretic perspective to calculate these maps.

Khovanov homology

Khovanov homology is (relatively) computable.

Example. $J = 17nh_{73}$ (the “positron knot”)

Dirk Schuetz's *KnotJob* calculates $\text{Kh}(J)$ in <1 sec (on 2013 MacBook).

R.I.P.

August 2013 - April 25, 2022

Performed > 1.6 million KnotJob calculations.

Khovanov homology is (relatively) computable.

Example. $J = 17nh_{73}$ (the “positron knot”)

Dirk Schuetz's *KnotJob* calculates $\text{Kh}(J)$ in <1 sec (on 2013 MacBook).

Kh(J)/ Tors

$h \backslash q$	-3	-2	-1	0	1	2	3	4	5	6	7	8	9	10
19														\mathbb{Z}
17														
15													\mathbb{Z}	
13										\mathbb{Z}	\mathbb{Z}

How can we use Khovanov homology in dimension 4?

Most 4D applications use Rasmussen's invariant $s(K) \in 2\mathbb{Z}$

$$\Rightarrow g(\Sigma) \geq |s(K)|/2$$

$$\implies \text{Kh}(\Sigma) : \text{Kh}^{h, \mathbf{q}}(L_0) \rightarrow \text{Kh}^{h, \mathbf{q} + \chi(\Sigma)}(L_1)$$

Theorem (Jacobsson, Bar-Natan, Khovanov, Morrison-Walker-Wedrich)

$\text{Kh}(\Sigma)$ is invariant (up to sign) under smooth isotopy rel $\partial\Sigma$.

Can these maps distinguish non-isotopic embeddings?

Rasmussen, Tanaka ('05-06): Not if Σ is closed (i.e., $\partial\Sigma = \emptyset$).

Sundberg-Swann ('21): $\text{Kh}(\cdot)$ can distinguish certain disks in B^4 .

- $D, D' : \emptyset \rightarrow K \implies \text{Kh}(D), \text{Kh}(D') : \mathbb{Z} \rightarrow \text{Kh}(K)$
- Showed $\text{Kh}(D)(1) \neq \text{Kh}(D')(1)$ in $\text{Kh}(K)$.

\neq

(For code that checks nontriviality of Khovanov homology classes, check out [imsundberg.github.io](https://github.com/imsundberg))

In fact, Khovanov homology distinguishes many pairs of disks.

9_{46}

6_1 (stevedore knot)

$15n_{103488}$

$17nh_{73}$ (positron knot)

In fact, Khovanov homology distinguishes many pairs of disks.

9_{46}

6_1 (stevedore knot)

$15n_{103488}$

$17nh_{73}$ (positron knot)

In fact, Khovanov homology distinguishes many pairs of disks.

9_{46}

6_1 (stevedore knot)

$15n_{103488}$

$17nh_{73}$ (positron knot)

Note: Several of these embed holomorphically in $B^4 \subset \mathbb{C}^2$.

9_{46}

6_1 (stevedore knot)

$15n_{103488}$

$17nh_{73}$ (positron knot)

Note: Some already distinguished by $\pi_1(S^3 \setminus K) \rightarrow \pi_1(B^4 \setminus D)$!

9_{46}

6_1 (stevedore knot)

$15n_{103488}$

$17nh_{73}$ (positron knot)

Theorem (H-Sundberg, 2021)

Khovanov homology can distinguish smooth surfaces (of all genera) in B^4 that are isotopic via homeos but not diffeos of B^4 (rel ∂).

Further work:

- **Lipshitz-Sarkar '21:** Mixed Kh-invariant for *non*-orientable surfaces
- **Lipshitz-Sarkar '22:** Distinguish surfaces via spectral sequence relating Kh of equivariant knot and its quotients

Theorem (H-Sundberg, 2021)

Khovanov homology can distinguish smooth surfaces (of all genera) in B^4 that are isotopic via homeos but not diffeos of B^4 (rel ∂).

Further work:

- **Lipshitz-Sarkar '21:** Mixed Kh-invariant for *non*-orientable surfaces
- **Lipshitz-Sarkar '22:** Distinguish surfaces via spectral sequence relating Kh of equivariant knot and its quotients

$15n_{103488}$

$17nh_{73}$ (positron knot)

Instead, we'll consider braids and braided surfaces.

Braided surfaces

Rudolph '84: Ribbon surfaces in B^4 are isotopic to *braided surfaces*.

Rudolph '84: Ribbon surfaces in B^4 are isotopic to *braided surfaces*.

Informal 3D definition

braided surface = a finite collection of parallel disks joined by half-twisted bands (with “ribbon” intersections)

Formal 4D definition

A smooth surface Σ in $B^4 \approx D^2 \times D^2$ is *braided* if the first-coordinate projection $D^2 \times D^2 \rightarrow D^2$ restricts to a simple branched covering $\Sigma \rightarrow D^2$.

Braided surfaces are encoded by factorizations $\beta = \prod_{k=1}^{\ell} w_k \sigma_{i_k}^{\pm 1} w_k^{-1}$.

Rudolph '83, Boileau-Orevkov '01:

$$\left\{ \begin{array}{l} \text{Bounded complex} \\ \text{curves in } B^4 \subset \mathbb{C}^2 \end{array} \right\} \longleftrightarrow \left\{ \begin{array}{l} \text{pos. braided} \\ \text{surfaces} \end{array} \right\} \longleftrightarrow \left\{ \prod_k w_k \sigma_{i_k}^{+1} w_k^{-1} \right\}$$

Inequivalent factorizations can yield inequivalent surfaces.

Example (Auroux): $(\sigma_2^{-2}\sigma_1\sigma_2^2)\sigma_1^2 = (\sigma_1^{-3}\sigma_1\sigma_3)\sigma_1\sigma_2 \in B_3$

\neq

Inequivalent factorizations can yield inequivalent surfaces.

Example (Auroux): $(\sigma_2^{-2}\sigma_1\sigma_2^2)\sigma_1^2 = (\sigma_1^{-3}\sigma_1\sigma_3)\sigma_1\sigma_2 \in B_3$

\neq

Braided surfaces and Khovanov homology

Khovanov homology has elementary maps associated to

- births/deaths
- saddles
- Reidemeister moves (R_1 , R_2 , R_3)

Braided surfaces do not require R_3 .

\implies Easier to work with in theory, practice, and on computer.

[For code that computes cobordism maps for braided surfaces (in the near future), check out Alan Du's github.]

Combine these to get other cobordisms. For example:

Note: The induced map is the “identity” on \times but kills $\rangle \langle$.

How does Khovanov homology relate to braids / braid factorizations?

Plamenevskaya'06: Khovanov homology contains a braid invariant.

$$\psi(\beta) \in \text{Kh}$$

Recipe: Oriented (braid-like) resolution at every crossing, assign every circle the element $x \in \mathcal{A} = \mathbb{Z}[x]/(x^2)$.

Plamenevskaya: If Σ is positively braided, then $\psi(\partial\Sigma) \xrightarrow{\text{Kh}(\Sigma)} \pm 1$.

- ✓ Useful for showing that $\text{Kh}(\Sigma)$ is nonvanishing.
- ✗ Not useful for *distinguishing* positively braided surfaces.

Does Khovanov homology contain a more sensitive invariant associated to a (quasipositive) *braid factorization*?

Example. The knot 10_{148} bounds ≥ 2 positively braided surfaces:

Note: No obvious reason that equivariant considerations could apply here; 10_{148} has no symmetries.

Candidate? Oriented resolutions at core σ_i of each band $w\sigma_iw^{-1}$ and *disoriented* resolutions elsewhere.

Candidate? Oriented resolutions at core σ_i of each band $w\sigma_i w^{-1}$ and *disoriented* resolutions elsewhere. [And add labels 1, x appropriately...]

E.g., this element gets sent to ± 1 by $\text{Kh}(\Sigma)$ and to 0 by $\text{Kh}(\Sigma')$. ✓

So can we apply this to our desired examples?

Sadly, such elements $\phi_1 \in \text{CKh}(\beta)$ aren't usually cycles. But can often be "completed" to a cycle by adding some $\phi_0 \in \ker(\text{CKh}(\Sigma))$.

+

Lastly, some motivational bad news.

Gompf '91: The knot $12n_{121}$ bounds ∞ 'ly many knotted tori whose branched covers are distinguished by Seiberg-Witten invariants.

Theorem (Du-H, 2022)

Infinitely many of these induce the the same map $\text{Kh}(12n_{121}) \rightarrow \mathbb{Z}$.

Can we enrich Khovanov homology to distinguish surfaces like this?

strong parallel: $\left\{ \begin{array}{c} \text{invariants of surfaces} \\ \text{in 4-manifolds} \end{array} \right\} \longleftrightarrow \left\{ \begin{array}{c} \text{invariants of} \\ \text{4-manifolds} \end{array} \right\}$

Thank you!
